| Description | The class has been divided into teams, each of which is responsible for designing and carrying out a research project at the Panzner Wetlands that involves collection of field-based data. The teams will choose their own areas of focus and define their own research projects. It is expected that general areas of interest will include: the thickness of the organic soil layer; the depth to the water table; the species composition of the trees in the Panzner area, and the presence or absence of invasive species. Students will need to access the reserve in order to observe the features at the focus of their project, but I do not expect that there will be any collection or destructive sampling involved. |
